

Abstract

The invention concerns a substrate comprising a relief which defines a low level and a high level surface, spaced apart by a certain height not less than $1/10$ th of the characteristic dimensions of the patterns forming said high level, the latter representing from 1 to 65 % of the substrate surface. The invention also concerns methods for forming such a substrate, a glazing at least partly formed with said substrate and the use of said glazing for a building, urban installations, air, sea or land transport vehicles, display screens, lamps, backlights, furniture or electrical household equipment.
